## PETITION FOR *INTER PARTES* REVIEW OF U.S. PATENT NUMBER 6,306,141 UNDER 35 U.S.C. §§ 311-319

Edwards Lifesciences Corporation ("Edwards" or "Petitioner") hereby requests *Inter Partes* Review ("IPR") of Claims 1-22 in U.S. Patent Number 6,306,141 ("the '141 Patent") (**Exhibit 1001**). A detailed statement supporting the petition follows.

The requisite fee accompanies this request. If any additional fee is necessary, the Director is authorized to charge Deposit Account No. 50-5226. This document, together with all exhibits referenced herein, has been served on the patent owner at the addresses of record for the '141 Patent as reflected in the accompanying Certificate of Service.

### I. REAL PARTY IN INTEREST UNDER 37 C.F.R. 42.8(b)(1)

The Petitioner is EDWARDS LIFESCIENCES CORPORATION.

### II. GROUNDS FOR STANDING UNDER 37 C.F.R. 42.104(a)

Petitioner certifies that the '141 Patent is available for IPR and that Petitioner is not barred or estopped from requesting an IPR challenging the patent claims on the grounds identified herein.

### III. RELATED MATTERS UNDER 37 C.F.R. 42.8(b)(2)

Petitioner is not aware of any current judicial or administrative matters that would affect, or be affected by, a decision in this proceeding.

# IV. <u>DESIGNATION OF COUNSEL UNDER 37 C.F.R. 42.8(b)(3) and 42.10(a)-(b)</u>

Lead counsel for the Petitioner is David S. Moreland of Meunier Carlin & Curfman, LLC, USPTO Reg. No. 60,134. Backup counsel for the Petitioner is Gregory J. Carlin of Meunier Carlin & Curfman, LLC, USPTO Reg. No. 45,607. Pursuant to 37 C.F.R § 42.10(b), a Power of Attorney accompanies this petition.

### V. <u>SERVICE INFORMATION UNDER 37 C.F.R. 42.8(b)(4)</u>

Petitioner's lead counsel may be reached by phone at (678) 869-7749, by email at <a href="mailto:dmoreland@mcciplaw.com">dmoreland@mcciplaw.com</a>, and by facsimile at (404) 645-7707. Petitioner may be served as follows:

David S. Moreland MEUNIER CARLIN & CURFMAN, LLC 817 W. Peachtree Street NW, Suite 500 Atlanta, GA 30308

## VI. STATEMENT OF PRECISE RELIEF REQUESTED UNDER 37 C.F.R. §§ 42.22(a)(1) and 42.104(b)(1)-(2)

For the reasons presented herein, Petitioner seeks the following relief:

(Ground #1) Invalidation of Claims 1-22 of the '141 Patent ("the '141 Patent Claims") under 35 U.S.C. § 102(a) as being anticipated by Cragg *et al.*, *Nonsurgical Placement of Arterial Endoprostheses: A New Technique Using Nitinol Wire*, 147 Radiology No. 1, 261-263 (April 1983) ("Cragg I," Exhibit 1004);

(Ground #2) Invalidation of Claims 1-22 of the '141 Patent under 35 U.S.C. § 102(a) as being anticipated by Cragg et al., *A New Percutaneous Vena Cava Filter*, 141:601-604 (September 1983) ("Cragg II," **Exhibit 1005**) or, alternatively, under 35 U.S.C. § 103(a) as being obvious in view of Cragg I and Cragg II.

(Ground #3) Invalidation of Claims 1-22 of the '141 Patent under 35 U.S.C. § 103(a) as being obvious in view of Japanese Patent Publication No. S58-46923 to Miyauchi et al. ("Miyauchi," Japanese publication at Exhibit 1024, and certified English translation at Exhibit 1006) in view of Cragg I.

(Ground #4) Invalidation of Claims 1-22 of the '141 Patent under 35 U.S.C. § 103(a) as being obvious in view of U.S. Patent No. 3,620,212 to Fannon ("the '212 Patent," Exhibit 1007) in view of Cragg I.

(**Ground #5**) Invalidation of Claims 1-22 of the '141 Patent under the doctrine of obviousness-type double patenting over the claims of U.S. Patent No.

5,597,378 to Jervis ("the '378 Patent," **Exhibit 1007**), filed October 2, 1992; issued on January 28, 1997; and expired on May 4, 2004.

# VII. HOW THE CHALLENGED CLAIMS ARE TO BE CONSTRUED UNDER 37 C.F.R. § 42.104(b)(3)

The '141 Patent Claims should be accorded their "broadest reasonable construction" in light of the specification of the '141 Patent. 37 C.F.R. § 42.100(b).

# VIII. REASONS FOR THE RELIEF REQUESTED UNDER 37 C.F.R. § 42.22(a)(2) and 42.104(b)(4) SHOWING THAT THERE IS A REASONABLE LIKELIHOOD THAT THE PETITIONER WILL PREVAIL UNDER 35 U.S.C. § 314(a)

The '141 Patent Claims are invalid in light of several prior art references and in view of an expired patent to the same inventor covering the same subject matter. As will be explored, the '141 Patent claims issued because the PTAB was provided incorrect information regarding the material properties of shape-memory alloys, in particular Nitinol, through a declaration of an "expert" in stress induced martensite submitted by the Applicant Medtronic during the prosecution of the '141 Patent. This declarant has since admitted that he is not and never was an expert in the relevant subject matter. But for this declaration, the '141 Patent would not have issued. When viewed under a clear lens, the '141 Patent is even more undeniably invalid in view of the prior art.

Further, the '141 Patent claims priority to U.S. Appl. No. 06/541,852 ("852 Application"), filed October 13, 1983. As a result of terminal disclaimers based on

obviousness-type double patenting rejections, the other patents issuing from the '852 Application all expired on May 4, 2004. The '141 Patent, however, was improperly granted without requiring a surrender of the patent term past this date. As such, the '141 Patent now exists as an improper extension of the patent monopoly and is invalid on those grounds too.

### A. Subject Matter of the '141 Patent

The '141 Patent Claims are generally directed to a medical device that includes (i) a shape memory alloy (SMA) element capable of displaying stress-induced martensite (SIM) at body temperature, and (ii) a placement device for delivery of the SMA element into a mammal (*see* '141 Patent (**Exhibit 1001**) at 2:59 to 3:4 and 10:59 to 14:23). SMAs display a "martensitic" phase and an "austenitic" phase. Just as water can transform between various phases (*e.g.*, vapor, liquid, ice), SMAs can reversibly transform between their austenitic and martensitic phases/states.

The transformation between these phases can occur as a result of a change in temperature or stress. For example, just like when H<sub>2</sub>O is in its liquid phase (water) and is sufficiently cooled, it transforms to its solid state (ice). When a SMA is in its austenite phase and it is sufficiently cooled, it transforms to its martensite phase. This transformation as a result of temperature is referred to as "thermally induced martensite" or "TIM." Likewise, the application of sufficient stress to a

SMA when in its austenite phase will transform the SMA to its martensite phase. This transformation as a result of stress is referred to as "stress induced martensite" or "SIM" (see '141 Patent at 1:52-53). Importantly, every SMA that exhibits TIM also exhibits SIM. That is, these martensitic transformations are equivalent and inherent material properties of the SMA. This fact was never disclosed by the Applicant. To the contrary, the Board of Patent Appeals and Interferences ("the Board") was misled into concluding that not all SMAs that exhibit TIM exhibit SIM (*i.e.*, that additional processing is required to exhibit SIM) (*see generally* Exhibit 1019). Moreover, the Board allowed the '141 Patent Claims based on this incorrect belief (*see generally* Exhibit 1016).

SMAs have a "shape memory" property that enables them to memorize their austenitic shape. That memory can be exhibited in several ways: thermal shape memory, pseudoelasticity, and mechanical shape memory. Thermal shape memory refers to when one sufficiently cools an SMA containing austenite to form thermally induced martensite, deforms the martensite, and then heats the alloy so that it reverts from thermally induced martensite back to its undeformed austenitic state ('141 Patent at 2:23-28). Pseudoelasticity refers to the conversion of austenite to martensite, but where the martensite is formed by the application of stress (rather than by significant cooling), and the release of stress allows the austenite phase to be restored ('141 Patent at 1:52—2:1). Mechanical shape memory is

similar to pseudoelasticity, in that martensite is formed by the application of stress, but the stress-induced martensite is stable until the austenite transformation start temperature  $(A_s)$  of the SMA is reached (*see id.*).

Each of the shape memory properties described above may exist as natural material properties of Nitinol. Nitinol is a well-known SMA formed of nickel and titanium, and was frequently used in self-expanding medical devices in the late 1970's and early 1980's. Nitinol is disclosed in all of the prior art references discussed herein (and is discussed in detail in the '141 Patent (see '141 Patent at 9:14 to 10:7)).

An understanding of the material properties of Nitinol and its transformation temperatures is important in assessing the validity of the '141 Patent Claims. To assist the Board in that regard, Petitioners have submitted the declaration of Dr. Ming H. Wu ("Expert Report" or "ER," **Exhibit 1002**). Dr. Wu has extensive knowledge of SMAs, including over 30 years of experience in the use of SMAs in medical devices. Dr. Wu specifically addresses the material properties of Nitinol, the prior art disclosing the use of Nitinol in medical devices, and the relevance of these disclosures to the '141 Patent Claims.

## B. Prosecution History: Issuance of the '141 Patent Based on a Misunderstanding of the Properties of SMAs and Nitinol

The '141 Patent characterizes its alleged improvement as a medical device using "the substitution of an alloy element which displays stress-induced martensite

at body temperature" in place of using thermally induced martensite to achieve the same result (*see* '141 Patent at 3:1-4 (emphasis added)). Thus, the basic premise of the '141 Patent (in its own terms) is to substitute one well-known SMA material property, stress induced martensite (SIM), for another well-known and equivalent material property, thermally induced martensite (TIM) (*see* '141 Patent at 1:52-59 (admitting that SMAs that exhibit SIM were well known in the art)). Indeed, the Applicant recognized the alleged invention's lack of novelty, conceding it was only a "basic improvement" that "uses stress-induced martensite material in place of conventional [thermally induced] shape memory alloy material" (Remarks to Office Action (**Exhibit 1017**) at 3).

Under KSR Int'l Co. v. Teleflex, Inc., 550 U.S. 398 (2007) and its progeny, substitution of a known material element to obtain a predictable result fails the threshold for patentability. See, e.g., Unigene Labs., Inc. v. Apotex, Inc., 655 F.3d 1352, 1361 (Fed. Cir. 2011) ("[D]esign need and market pressure may dictate a commonsensical path using a finite number of identified predictable solutions to one of ordinary skill...."); see also In re Chevalier, 500 Fed. Appx. 932, 935 (Fed. Cir. 2013) (ruling that "recognized equivalents performing the same function" rendered claims obvious based on KSR's recognition that "when a patent claims a

<sup>&</sup>lt;sup>1</sup> The '141 Patent was granted on October 23, 2001, thus *before* the Supreme Court's April 30, 2007 *KSR* decision.

structure already known in the prior art that is altered by the mere substitution of one element for another known in the field, the combination must do more than yield a predictable result.") (citing *KSR*, 550 U.S. at 416).

Moreover, as explained by Dr. Wu, no substitution was required. The '141 Patent *incorrectly* suggests that the known shape memory elements in medical devices only exhibited thermally induced martensite (TIM) ('141 Patent at 1:26—2:54, 9:14—10:7). However, the prior art expressly recognized and relied upon the SMA material property of stress induced martensite (SIM) and its conversion back to austenite (*see*, *e.g.*, ER §VII). In other words, the prior art disclosed the use of SIM (rather than TIM) to obtain the desired shape memory property in self-expanding medical devices. The '141 Patent Claims are invalid in view of such prior art.

In prosecuting the '141 Patent, the Applicant Medtronic argued that all Nitinol SMAs that exhibit thermally induced martensite (TIM) do not exhibit stress induced martensite (SIM). More particularly, the Examiner issued a Final Office Action rejecting the '141 Patent Claims as obvious (Final OA, Sept. 15, 1997 (Exhibit 1025) at 2-3). Medtronic appealed and submitted a declaration by Dr. Lee Middleman, whom Medtronic represented as "an expert in the field of stress-induced martensite (SIM) alloy elements" (141 History, Appeal Brief, Jun. 18, 1998 (Exhibit 1025) at 18). Dr. Middleman stated:

Although nitinol can exhibit properties of an SIM material, it can do so *only if it undergoes a treatment process to make it exhibit the properties of an SIM material*. This process requires an extensive, time consuming, and expensive procedure. Where is the suggestion in Balko or any of the other references to use nitinol exhibiting SIM behavior rather than less expensive conventional Nitinol? There is no such suggestion....

(Middleman Decl. (Exhibit 1019) at 4 (emphasis added)).

The Board in turn reversed the Examiner's decisions, relying *inter alia* on Dr. Middleman's declaration:

As shown by Kirk-Othmer and the Middleman declaration, nitinol does not exhibit SIM properties unless it receives additional treatment, of which there is no suggestion in Balko. We therefore conclude that the examiner has not made out a prima facie case that the SMAs disclosed by Balko would inherently display SIM properties.

(Id. at Decision on Appeal, Feb. 26, 2001, p. 6 (emphasis added).)

While the Board understandably accepted Dr. Middleman's representations in the *ex parte* process (because Medtronic represented that Middleman was an expert in SIM with knowledge of Nitinol processing), the reality is that Dr. Middleman was not then and is not now an expert in SIM or Nitinol. Indeed, during the course of subsequent litigation regarding the '141 Patent, Dr. Middleman admitted that he is *not* an expert in either (see Middleman Deposition

(Exhibit 1028) at pp. 29, 34, 100, 146-148, 229 (testifying that he "was definitely not an expert in Nitinol" and was "absolutely not" an expert in "stress-induced martensite")).

In contrast, Dr. Wu (an actual expert in SMAs), explains that all SMAs including Nitinol that can exhibit thermally induced martensite (TIM) can also exhibit stress induced martensite (SIM) (ER §§IV-VII). This follows fundamental thermodynamic principles, and no special treatment is required for a Nitinol alloy that exhibits TIM to also exhibit SIM (ER §§IV-VII). The requirement for "an additional treatment" process that is "extensive, time-consuming and expensive," as set forth in the Middleman declaration is quite simply incorrect (*see* ER VI).

All of the prior art references relied on herein use a Nitinol alloy element in a self-expanding medical device. In considering them, it is important to keep in mind the following fundamental material properties of SMAs:

- Shape memory alloys that are capable of exhibiting TIM are also capable of exhibiting SIM (see, e.g., ER §IV).
- All Nitinol SMAs exhibit SIM between their M<sub>f</sub> and M<sub>d</sub> temperatures (*see*, *e.g.*, ER §IV). (The M<sub>f</sub> temperature is the temperature at which the SMA is fully martensitic based solely on the temperature; the M<sub>d</sub> temperature is the temperature above which martensite will no longer form under stress (*see id.*)).

- All Nitinol SMAs exhibit pseudoelasticity between A<sub>s</sub> and M<sub>d</sub> temperatures (*see*, *e.g.*, ER §IV). (The A<sub>s</sub> temperature is the temperature at which martensite begins to revert back to austenite—whether formed through stress or temperature (*see id.*)).
- All Nitinol SMAs are thus indisputably pseudoelastic shape memory alloys (see, e.g., ER §§IV-VIII).

Dr. Wu, an acknowledged expert in SMA's, states the scientific bases for these fundamental properties in his declaration attached as **Exhibit 1002**.

### C. Construction of the '141 Patent Claim Terms

The claims are construed as a person of ordinary skill in the art would understand them and are to be given their broadest reasonable construction. For example, Claim 1 recites that "the alloy is selected so that the transformation <u>can occur</u> without any change in temperature of the placement device or the memory alloy element." The "transformation" in the claim is the transformation of the medical device from stress-induced martensite (SIM) to austenite. The time of transformation (as dictated by the claims) is when the medical device is released from the placement device inside the mammal. Thus, to one of ordinary skill in the art, the SMA selected must merely *be capable of* transforming (note use of phrase "can occur") from SIM to austenite when placed in the body "without any change

in temperature of the ... memory alloy element" (ER §VIII).<sup>2</sup> This limitation is met when an alloy is selected that has an A<sub>s</sub> temperature below body temperature (*id.*). With such an A<sub>s</sub> temperature, the memory alloy device self-expands when released in the body without requiring a change in temperature, which is exactly what is disclosed in the prior art (ER §§VII-VIII).

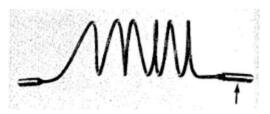

Other claim terms and limitations should similarly be given their broadest reasonable construction. For example, consistent with this approach, the patent teaches a broad definition of "catheters" to include "cannulas" (see '141 Patent at 5:60-62 ("both [terms] being included hereinafter in the word "catheter")).

<sup>&</sup>lt;sup>2</sup> Non-limiting language as it relates to the "change in temperature" limitation is similarly used throughout the independent claims: Claim 11 ("without any change in temperature ... *being required*"); Claim 15 ("*selected* so that the transformation *can occur* without any change in temperature"); Claim 16 ("*can occur* without a change in temperature"); Claim 18 ("*selected* so the transformation *can occur* without any change in temperature"). Such limitations similarly require only that the selected SMA *be capable of* transforming from SIM to austenite when released in the body without a change in temperature, not that the SMA actually transform without a change in temperature (even though the prior art does disclose such a transformation without a change in temperature) (ER §§VII-VIII).

### **D.** Invalidity Analysis

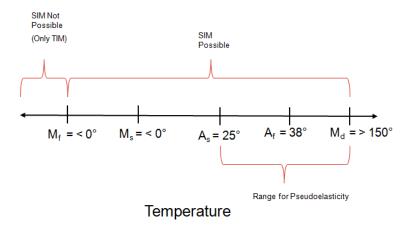

### a. Claims 1-22 are anticipated by Cragg I under § 102(a)

Cragg I discloses a Nitinol coil stent configured for delivery into a human body using a catheter (261-62, Fig. 1). Cragg I is prior art under 35 U.S.C § 102(a) (published at least as early as March 22, 1983) and was admitted as prior art in the '141 Patent. Cragg I discloses a Nitinol coil stent that can be deformed to a straight wire and placed in a catheter (261-62). When the Nitinol coil is extended out of the catheter into the blood vessel, it transforms back to an unstressed austenitic state to maintain the patency of the vessel (261-62):

**Cragg I Figure 1** 

Cragg I's Nitinol coil stent meets the limitations of the '141 Patent Claims. For example, the  $A_s$  temperature of the Cragg I device is 25° C, and its  $A_f$  temperature is about body temperature (approximately 36-38° C) (262, ER §VII). Further, Cragg I teaches annealing the Nitinol wire, so that its  $M_s$  and  $M_f$  temperatures are well below 0° C (ER §VII). Therefore, the Cragg I Nitinol alloy has the following martensite and austenite transformation temperatures (ER §VII):

Cragg I further discloses that its Nitinol stent is cooled in ice water and then deformed (261). The temperature of the coil when deformed is thus necessarily above the wire's M<sub>s</sub> temperature (*i.e.*, above 0° C). The deformation of the coil causes stress-induced martensite (ER §VII). The deformed Nitinol is then placed in a catheter and delivered to a blood vessel. As the delivery catheter is positioned in the human body, the Nitinol stent temperature rises to and remains at body temperature (*i.e.*, above the A<sub>s</sub> and A<sub>f</sub> temperatures) (262, ER §VII). When extended from the catheter, the wire transforms from SIM to austenite without requiring a change in temperature (262, ER §VII). Accordingly, Cragg I discloses utilizing SIM and a pseudoelastic stent, which is what is recited in the '141 Patent Claims. This is set forth more fully in the claim chart at the end of this petition (Section VIII.C.e.).<sup>3</sup>

<sup>&</sup>lt;sup>3</sup> A more detailed claim chart accompanies Dr. Wu's expert report (Exhibit 1002).

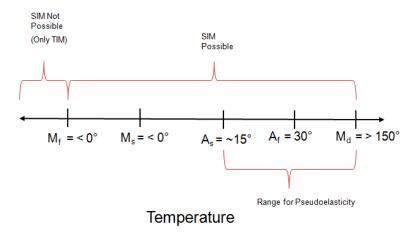

## b. Claims 1-22 are anticipated by Cragg II under § 102(a) or rendered obvious in view of Cragg II and Cragg I under § 103(a)

Cragg II, which was *not* before the Patent Office during the examination of the '141 Patent, is prior art under 35 U.S.C § 102(a) (published at least as early as August 25, 1983). It discloses a Nitinol wire coil filter that displays stress-induced martensite (SIM) when deformed within a catheter while being positioned for placement in a human blood vessel (ER §VII). Specifically, the Cragg II filter is a self-expanding Nitinol wire coil delivered by a Teflon catheter (601, FIG. 1B):

Cragg II FIG. 1B

The coil is annealed and then cooled in ice water, at which time it is stressed into a straightened (*i.e.*, deformed) shape (602). Cragg II provides that the "transition temperature" (*i.e.*, the A<sub>f</sub> temperature) is "about 30°C for the alloy used in this study" (601, ER §VII). Also, because the wire is annealed, the M<sub>s</sub> and M<sub>f</sub> temperatures are well below 0° C (ER §VII). Hence, the wire coil disclosed in Cragg II exhibits the following temperature ranges (ER §VII):

Because the ice water temperature is higher than even the most conservative  $M_S$  temperature (minus 4° C, see ER §VII), drawing the wire filter into the catheter would straighten the Nitinol wire into a deformed shape *through the formation of stress-induced martensite* (and not through the formation of thermally induced martensite). That is, the initial deformation of the wire coil when drawn into the catheter necessarily causes SIM – not TIM.

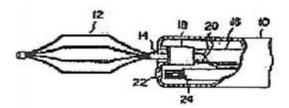

Cragg II further provides that the "catheter with the loaded wire [filter] ... was deposited in the vena cava by withdrawing the catheter over the adapting wire" (602). As the wire is deployed, the Cragg I filter resumes its coil shape (602). Because the temperature of the wire in the catheter necessarily reaches and remains at its A<sub>s</sub> temperature upon insertion into the body, when extended from the catheter the Nitinol alloy wire filter in Cragg II goes from a SIM state to an unstressed austenitic state (the transformation from SIM to austenite occurring without a change in temperature) (602, ER §VII).

Further, Cragg II discloses using the pseudoelastic properties of the Nitinol alloy when repositioning the wire filter. As stated, "[i]f the position of the filter was not optimal, it could be withdrawn into the catheter and positioned again .... In two animals, the original placement of the filters was not optimal. These filters were withdrawn into the catheter and successfully repositioned" (602). This repositioning thus also discloses that the catheter stresses the Nitinol wire filter into a deformed shape at body temperature, causing the SMA to transform from austenite to SIM (ER §VII). Then, when the filter is re-delivered into the body, the filter is at body temperature and above its A<sub>s</sub> and A<sub>f</sub> temperatures. This <u>again</u> causes the Nitinol alloy to transform from SIM to unstressed austenite without a change in temperature. Accordingly, Cragg II contains multiple disclosures utilizing SIM and a pseudoelastic SMA that meets the limitations of the '141 Patent Claims (see claim chart below, Section VIII.C.e.).

Cragg II discloses using a coil wire filter that has a similar configuration to that of a coil stent. To any extent that Cragg I may not disclose a stent, it would have been obvious to combine the teachings of Cragg I with the coil wire filter for the reasons detailed in Dr. Wu's declaration (*e.g.*, common sense of one ordinary skill in the art, commercial promise of utilizing Nitinol in medical applications, promising trial results using Nitinol in stents) (see ER §§VII-VIII).

c. Claims 1-22 are obvious in view of Miyauchi and Cragg I under § 103(a)

Miyauchi was <u>not</u> considered during prosecution of the '141 Patent. Miyauchi was published on March 18, 1983 and qualifies as prior art under 35 U.S.C. § 102(a). Miyauchi discloses a Nitinol alloy manipulation tool (12) for insertion into a human body through an endoscope sheath (10) (Miyauchi (**Exhibit 1006**) at 97; Fig. 1). In its martensitic state, the Nitinol tool (12) has a deformed shape "long in the lengthwise direction" for movement through the sheath (10) (*see id.* at 99). In its unstressed austenitic state, the Miyauchi Nitinol tool (12) reverts to a basket forceps configuration for removing body debris (*id.* at 98-99; *see also* Fig. 1).

Miyauchi Figure 1

Key elements of the '141 Patent Claims read on Miyauchi's Nitinol tool. Miyauchi specifically discloses that its Nitinol tool's martensitic state can be reached by changing temperature or stress (*id.* at 97-99). The Nitinol tool (12) can be stress-induced to its martensitic state at body temperature (without any change in temperature) by being pulled into its sheath (10) when inside a body cavity and returned to its original, austenitic state upon extrusion from the sheath (10) within the body cavity (again, without a temperature change) (*id.* at 99). Accordingly, the

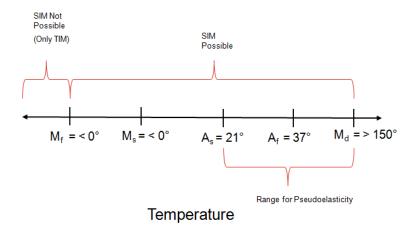

Nitinol tool is pseudoelastic and capable of exhibiting a transformation from SIM to austenite at body temperature without a change in temperature (ER §§IV-VIII).

Both Miyauchi and Cragg I relate to self-expanding medical devices deploying shape memory alloy elements used in body cavities. A person of ordinary skill would have found it obvious to utilize the teachings of Miyauchi for the placement of a coil stent disclosed in Cragg I as detailed in Dr. Wu's declaration (see ER §§VII-VIII). A claim chart follows identifying where each of the '141 Patent Claims are disclosed in Miyauchi and Cragg I (Section VIII.C.e.).

## d. Claims 1-22 are obvious in view of the '212 Patent and Cragg I under § 103(a)

The '212 Patent, granted over twelve years before the priority date for the '141 Patent, qualifies as prior art under 35 U.S.C. § 102(b). It discloses a self-expanding contraceptive device made from Nitinol alloy (*see*, *e.g.*, '212 Patent (**Exhibit 1007**) at Abstract and 2:54-59). The '212 Patent discloses use of shape memory alloy elements having  $A_f$  and  $A_s$  temperatures near or below body temperature; specifically, the '212 Patent states that "[t]he devices will reform when they reach a temperature around body temperature" and "begin reforming at around 70° F" ('212 Patent at 3:16-21). This means that  $A_f = 37^{\circ}$  C (98° F) and  $A_s = 21^{\circ}$  C (70° F) (ER §VII). Because the patent discloses that the SMA is annealed at a high temperature to achieve these  $A_s$  and  $A_f$  temperatures, it is certain that the

 $M_s$  and  $M_f$  temperatures are well below 0° C (ER §VII). The temperature properties of the Nitinol alloy disclosed in the '212 Patent are as follows:

The '212 Patent discloses stressing the pseudoelastic SMA device and constraining it within a cannula ('212 Patent at 2:54—3:15; ER §VII). Further, the '212 Patent teaches that, because the A<sub>s</sub> temperature is low (*i.e.*, 21° C or 70° F), the device could be either kept below this temperature or constrained prior to entry into the body through the cannula ('212 Patent at 3:16-29). Accordingly, the '212 Patent teaches that above A<sub>s</sub> the Nitinol device will be constrained and will not expand (ER §VII). Because the device's A<sub>s</sub> temperature is necessarily reached upon insertion into the body while in the cannula, the self-expanding medical device displays stress-induced martensite at body temperature (SIM) (ER §VII). It then transforms from SIM to its austenite shape without a temperature change (*id.*).

Both the '212 Patent and Cragg I relate to self-expanding medical devices deploying shape memory alloy elements used in body cavities. A person of

ordinary skill would have found it obvious to utilize the teachings of the '212 Patent for the placement of a coil stent in view of Cragg I (see ER §§VII-VIII). A claim chart identifying where the '141 Patent Claims are disclosed in the '212 Patent and Cragg I follows (Section VIII.C.e.).

### e. Claim chart supporting invalidity grounds 1 through 4

| '141 Patent  | Cragg I (Ex. 1004), Cragg II (Ex. 1005),<br>Miyauchi (Ex. 1006), and '212 Patent (Ex. 1007)                                     |
|--|---|
| 1. A medical device for insertion into a mammalian body, | Cragg I discloses a wire coil stent for insertion into a human body (261).  |
| the device comprising:                                   | <b>Cragg II</b> discloses a coil filter for insertion into a human body (602).  |
|  | <b>Miyauchi</b> discloses a "manipulation tool" for insertion into a human body (99).   |
|  | The '212 patent discloses a contraceptive device for insertion into a human body (Abstract).                                    |
| (a) a hollow placement device;                           | Cragg I discloses a hollow catheter for placing the coil stent (261).   |
|  | <b>Cragg II</b> discloses a catheter for placing the filter (602).  |
|  | <b>Miyauchi</b> discloses a hollow endoscope for placing the manipulation tool (98).  |
|  | The '212 patent discloses a hollow cannula ( <i>i.e.</i> , catheter) for restraining the deformed contraceptive device (3:2-8). |
| (b) a memory allow element formed at least partly from   | The coil stent in <b>Cragg I</b> is made from Nitinol, a pseudoelastic shape memory alloy (261; ER §§VII-VIII).                 |
| pseudoelastic shape<br>memory alloy,                     | The coil filter in <b>Cragg II</b> is made from Nitinol, a pseudoelastic shape memory alloy (601; ER §§VII-VIII).               |
|  | The manipulation tool in <b>Miyauchi</b> is made from a SMA   |

that has "so-called 'pseudoelasticity' or 'superelasticity'" (99; ER §§VII-VIII).

The '212 patent discloses a Nitinol pseudoelastic shape memory alloy with an As below body temperature (2:54-59; §§VII-VIII).

the alloy displaying reversible stressinduced martensite at about body temperature such that it has a stressinduced martensitic state and an austenitic state, At about body temperature (~37° C), the Nitinol disclosed in **Cragg I** displays a SIM state and an austenitic state (261 ("At or near body temperature the wire transforms into its original shape"); ER §§VII-VIII). The presence of friction in the catheter when inserted into the body confirms this (262; ER §§VII-VIII).

At about body temperature, the Nitinol filter in **Cragg II** has a SIM state and an austenitic state (602; ER §§VII-VIII). When inserted into the body, the Nitinol filter approaches body temperature, which is above  $A_s$  and  $A_f$  temperatures (ER §§VII-VIII). This causes the filter to display SIM while constrained by the catheter (ER §§VII-VIII). Further, Cragg II discloses that "[i]f the position of the filter [is] not optimal, it [can] be withdrawn into the catheter and positioned again" (602). Doing so causes the filter to again display reversible SIM and austenite at about body temperature (602; ER §§VII-VIII).

**Miyauchi** discloses that "a [pseudoelastic] shape-memory alloy" that "returns to the shape of the usable state, and after a calculus ... is captured within a body cavity ... is removed [] from the forceps insertion hole ... in the direction opposite to the insertion" (99). This removal causes the alloy to be compressed within the endoscope and change from an austenitic state to a SIM state at about body temperature (99; ER §§VII-VIII).

The '212 patent discloses that "[t]he devices will reform when they reach a temperature around body temperature" (3:16-21). Thus, the contraceptive device displays a SIM state and an austenitic state at about body temperature (3:16-29; ER §§VII-VIII). When inserted, the Nitinol device approaches body temperature and displays

|                           | reversible SIM while constrained in the cannula ( <i>i.e.</i> ,      |
|---------------------------|--|
|                           | catheter) (3:16-29; ER §§VII-VIII).                                  |
| the memory alloy          | In <b>Cragg I</b> , the stent is deformed and drawn into a           |
| element having (i) a      | catheter, where it is stressed in a relatively straightened,         |

| when the alloy is in      | Nitinol resumes its unstressed shape ( <i>i.e.</i> , the stent shown |
| its stress-induced        | in FIG. 1) (262). The catheter prevents the stent from               |
| martensitic state and     | resuming its original shape, thus keeping it in a SIM state          |
| (ii) a different          | while constrained within the catheter (see 262 ("We also             |
| unstressed shape          | used a catheter to reduce friction of the partially                  |
| when the alloy is in      | transformed coil in the catheter."); ER §§VII-VIII).                 |
| its austenitic state; and | Cragg II discloses that the filter is straight when in its           |
| und                       | stress-induced martensitic state and coiled when in its              |
|                           | unstressed austenitic state (602; ER §§VII-VIII).                    |
|                           |  |
|                           | <b>Miyauchi</b> discloses that the manipulation tool has a           |
|                           | "usable shape" when in its unstressed austenitic state and           |
|                           | is deformed into a deformed shape when removed "from                 |
|                           | the forceps insertion hole of the endoscope operation                |
|                           | portion" (SIM state) (99; ER §§VII-VIII).                            |
|                           | The '212 patent discloses that the contraceptive device              |
|                           | has a "compact fold configuration" when in its SIM state             |
|                           | and a "free shape" or "original shape" when in its                   |
|                           | unstressed austenitic state (3:2-11; ER §§VII-VIII).                 |
| (c) a guide wire;         | Cragg I discloses that the Nitinol coil is "fastened to a            |
|                           | threaded guiding wire" (261).  |
|                           | Cragg II discloses that "the filter was quickly                      |
|                           | advanced by pushing on the delivery wire" (602).                     |
|                           | (00 <b>2</b> ).  |
|                           | The endoscope disclosed in <b>Miyauchi</b> functions in the          |
|                           | same capacity as a guide wire. Based on the teachings of             |
|                           | Cragg I, it would have been obvious to modify Miyauchi               |
|                           | to place a stent using a guide wire (ER §§VII-VIII).                 |
|                           | The '212 patent discloses placing the device in the body             |
|                           | through the use of a cannula (1:17-19), which the '141               |
|                           | Patent views the same as a catheter (see <b>Exhibit 1001</b> at      |

| the memory alloy element being within the hollow placement device,  The Nitinol coil stent in Cragg I is drawn within the hollow catheter for placement (261).  The coil filter in Cragg II is within the hollow catheter for placement (601-02).  The manipulation tool in Miyauchi is within the hollow endoscope (99 ("[A]t the end is provided a forceps hole 14 through which is passed a manipulation tool 12").  The contraceptive device in the '212 patent is within the hollow cannula (3:2-8).  Cragg I discloses that the Nitinol coil is "fastened to a threaded guiding wire to allow accurate placement after being deposited in the aorta" (261).  Cragg II discloses that the filter and catheter are "quickly advanced by pushing on the delivery wire" (602).  Because Miyauchi discloses the use of an endoscope to position the manipulation tool, it would have been obvious in view of Cragg I to use a guide wire (ER §§VII-VIII).  Because the '212 patent discloses placing the device in the body through the use of a cannula, it would have been obvious in view of the teaching of Cragg I to utilize a guide wire in place of the cannula (ER §§VII-VIII).  The A <sub>s</sub> in Cragg I is 25°C (262, ER §§VII-VIII). When the stent is inserted into the body, the Nitinol stent rises above A <sub>s</sub> , causing the catheter retains the stent in its deformed above A <sub>s</sub> the stent in its deformed above |                  | 5:61-62 (equating devices). Alternatively, it would have been obvious to modify the '212 Patent to place a stent using a guide wire in view of Cragg I (ER §§VII-VIII). |

### deformed shape,

§§VII-VIII). This stress retains the stent in its deformed shape (602; ER §§VII-VIII). Additionally, the catheter stresses the filter above  $A_s$  when the filter is repositioned by being withdrawn into the catheter (602; ER §§VII-VIII).

The  $A_s$  in **Miyauchi** is ~22° C (99; ER §§VII-VIII). When the manipulation tool is within the endoscope in the body it is at about body temperature, which is above  $A_s$  (99; ER §§VII-VIII). Thus, the stress at a temperature above  $A_s$  causes the tool to deform through SIM (99; ER §§VII-VIII).

The '212 patent discloses that the  $A_s$  of the contraceptive device is 21° C (3:21-25; ER §§VII-VIII). Because of this, the hollow the cannula "retard[s] the reforming of the device [] to its free shape when the device is inserted into the uterus" (3:2-8). The cannula stresses the device and keeps it in a deformed shape at a temperature above  $A_s$  (ER §§VII-VIII).

wherein the memory allov element can be extended from the hollow placement device by the guide wire at a temperature greater than the A<sub>s</sub> of the alloy to transform at least a portion of the alloy from its stressinduced martensitic state so that the memory alloy element transforms from its deformed shape to its unstressed shape,

**Cragg I's** Nitinol stent is "fastened to a threaded guiding wire to allow accurate placement after being deposited in the aorta" (261). As noted, the  $A_s$  is below body temperature. "As the coil is extruded from the catheter ... it reverts to its 'memorized' shape," that is, it transforms from its deformed shape to its unstressed shape (262; ER VII-VIII).

Because  $A_s$  is below body temperature in **Cragg II**, once the Nitinol is released from the catheter, it "rapidly resume[s] its original filter shape" (602; ER §§VII-VIII). This transforms at least a portion of the alloy from SIM to austenite (ER §§VII-VIII). Similarly, Cragg II discloses that the filter is extended from the catheter above  $A_s$  and also transforms from its deformed, stress-induced martensitic shape to its unstressed austenitic shape after repositioning (602; ER §§VII-VIII).

**Miyauchi** discloses that the reverse transformation range (*i.e.*, the  $A_s$  and  $A_f$  temperatures) can be between 30-50° C

(99; ER §§VII-VIII). Miyauchi discloses deploying the SMA device from the endoscope (*i.e.*, hollow placement device) at a temperature that is greater than the A<sub>s</sub> temperature of the tool (99; ER §§VII-VIII). Doing so causes a transformation from SIM to austenite while above the A<sub>s</sub> of the manipulation tool (99; ER §§VII-VIII). It would have been obvious in view of Cragg I to utilize a guide wire to deploy a stent (ER §§VII-VIII).

The '212 patent discloses that the A<sub>s</sub> of the contraceptive device is well below body temperature (3:21-25; ER §§VII-VIII). When extended from the cannula (catheter) at body temperature, the device transforms from SIM to austenite (hence transforming from its deformed shape to its unstressed shape) (ER §§VII-VIII). It would have been obvious in view of Cragg I to utilize a guide wire to deploy a stent (ER §§VII-VIII).

and wherein the alloy is selected so that the transformation can occur without any change in temperature of the placement device or the memory alloy element.

The A<sub>s</sub> in Cragg I is 25°C and the A<sub>f</sub> is "at or near body temperature" (261-62, ER §§VII-VIII). The Nitinol coil in Cragg I thus does not require any change in the temperature of the catheter or the Nitinol stent in order for the stent to transform from SIM to austenite when inside the body (ER §§VII-VIII).

**Cragg II** discloses that the temperature in the body is above the Nitinol filter's  $A_s$  temperature (602; ER §§VII-VIII). The filter thus transforms from a deformed, stressed shape to an unstressed shape without requiring any change in temperature when it is released from the catheter (ER §§VII-VIII).

**Miyauchi** discloses that its shape memory alloy does not require any change in temperature for the material to exhibit a pseudoelastic effect (99; ER §§VII-VIII). Because the A<sub>s</sub> temperature in Miyauchi is below body temperature, the manipulation tool exhibits pseudoelasticity at body temperature, allowing it to repeatedly transform from SIM to austenite without requiring any change in temperature (99-100; ER §§VII-VIII).

|   | The '212 patent discloses that the A <sub>s</sub> is below body temperature (3:21-25). As such, the SMA device transforms in the body from a deformed SIM state to an austenitic, unstressed state that occurs without requiring any change in temperature of the device (3:21-25; ER §§VII-VIII). |
|---|--|
| <b>2.</b> The device of claim 1, wherein the memory alloy   | <b>Cragg I</b> discloses that the wire coil graft "could be used as [a] stent[] to maintain vessel patency" (262).   |
| element is a stent.   | <b>Cragg II</b> discloses a Nitinol wire coil graft, which can be used as a stent to maintain vessel patency (or it would have been obvious to do so in view of Cragg I) (601; ER VII).  |
|   | Miyauchi shows a SMA device (manipulator 12) having a coiled structure similar to the stent of Cragg I in FIGS. 3(A)-3(C). It would have would have been obvious to alter Miyauchi to deploy a coil stent in view of Cragg I (ER §§VII-VIII).  |
|   | As already noted, it would have would have been obvious to modify the '212 patent to deploy a coil stent using a catheter and guide wire in view of Cragg I and other knowledge in the art (ER §\$VII-VIII).   |
| <b>3.</b> The device of claim 2, including a guide wire for | <b>Cragg I</b> discloses that its Nitinol coil is "fastened to a threaded guiding wire to allow accurate placement" (261).   |
| endarterial placement of a stent graft.                     | The wire coil filter in <b>Cragg II</b> is endarterially placed by a guide wire (602 "[A] delivery wire was screwed to the filter The filter was deposited in the vena cava by withdrawing the catheter over the adapting wire")).   |
|   | As previously noted, it would have been obvious to one of ordinary skill in the art to modify the teachings disclosed in <b>Miyauchi</b> and the '212 patent to deploy a self-expanding stent through the use of a catheter and guide wire (ER §§VII-VIII).  |
| <b>4.</b> The invention of claim 1 wherein the              | The Teflon catheter ( <i>i.e.</i> , placement device) in Cragg I does not exhibit a state change (262, ER §§VII-VIII).   |

| transformation   |  |
|--|--|
| occurs without any change in the state   | The Teflon catheter in <b>Cragg II</b> does not exhibit a state change (602, ER §§VII-VIII).   |
| of the placement device.   | The endoscope in <b>Miyauchi</b> does not exhibit a state change (99; ER §§VII-VIII).  |
|  | The cannula in the '212 patent does not exhibit a state change (1:17-19; ER §§VII-VIII).   |
| <b>5.</b> The device of claim 1, wherein the hollow placement                  | <b>Cragg I</b> discloses that the hollow placement device is a "10-F Teflon catheter" (261).   |
| device is a catheter.  | <b>Cragg II</b> provides that "[t]he catheter with the loaded nitinol wire was inserted and passed to the desired level in the inferior vena cava" (602).  |
|  | As previously noted, it would have been obvious to one of ordinary skill in the art to modify the teachings disclosed in <b>Miyauchi</b> to deploy a self-expanding stent through the use of a hollow catheter and guide wire (ER VII).                            |
|  | The '212 patent discloses that the hollow placement device is a catheter (3:2-10). The '141 Patent equates a cannula to a catheter (Exhibit 1001 at 5:61-62).  |
| <b>6.</b> A medical device which comprises:                                    | Cragg I, Cragg II, Miyauchi and the '212 patent each disclose a medical device for insertion into a human body (see Claim 1).  |
| (a) a stent for endarterial placement within a human body so that the stent is | Cragg I discloses a wire coil stent for endarterial placement substantially at human body temperature (262 ("Loosely wound coils could be used as stents to maintain vessel patency")).  |
| substantially at human body temperature,                                       | Cragg II discloses a wire coil filter for endarterial placement substantially at human body temperature (601-02). The wire coil can be used as a stent for endarterial placement (or it would have been obvious to do so in view of Cragg I) (601; ER §§VII-VIII). |
|  | It would have been obvious to adapt the uses of shape-<br>memory alloys as disclosed in <b>Miyauchi</b> and the '212   |

|  | patent to endarterially place a stent within a human body in view of Cragg I (ER §§VII-VIII).  |
|--|--|
| the stent comprising<br>a shape memory<br>alloy which displays<br>stress-induced<br>martensite behavior<br>at body temperature;<br>and | At about body temperature (~37° C), the Nitinol disclosed in <b>Cragg I</b> displays a SIM state and an austenitic state (261 ("At or near body temperature the wire transforms into its original shape"), ER §§VII-VIII). The presence of friction in the catheter when inserted into the body confirms this (262; ER §§VII-VIII).  |
|  | At about body temperature, the Nitinol filter in <b>Cragg II</b> has a SIM state and an austenitic state (602; ER §§VII-VIII). When inserted, the Nitinol filter approaches body temperature, which is above A <sub>s</sub> and A <sub>f</sub> temperatures (ER §§VII-VIII). This causes the filter to display SIM at about body temperature while constrained by the catheter (ER VII). Further, Cragg II discloses that "[i]f the position of the filter [is] not optimal, it [can] be withdrawn into the catheter and positioned again" (602). Doing so causes the filter to again display reversible SIM and austenite at about body temperature (602; ER §§VII-VIII). |
|  | Miyauchi discloses that "a [pseudoelastic] shape-memory alloy" that "returns to the shape of the usable state, and after a calculus is captured within a body cavity is removed [] from the forceps insertion hole in the direction opposite to the insertion" (99). This removal causes the alloy to be compressed within the endoscope and change from an austenitic state to a SIM state at about body temperature (99; ER §§VII-VIII).   |
|  | The '212 patent discloses that "[t]he devices will reform when they reach a temperature around body temperature" (3:16-21). The contraceptive device displays a SIM state and an austenitic state at about body temperature (3:16-29; ER §§VII-VIII). When inserted, the device approaches body temperature and displays reversible SIM while constrained by the cannula (3:16-29; ER §§VII-VIII).   |
| (b) a restraint holding the stent in a deformed  | The A <sub>s</sub> in <b>Cragg I</b> is 25°C (262, ER §§VII-VIII). When the stent is inserted into the body, the Nitinol stent rises above A <sub>s</sub> , causing the catheter to stress the stent and retain  |

| configuration at a temperature less than the body temperature of the human for endarterial positioning of the | the stent in its SIM state (262, ER §§VII-VIII). The catheter retains the stent in this deformed shape above A <sub>s</sub> (262; ER §§VII-VIII). The catheter also holds the stent in this deformed configuration at a temperature that is less than body temperature for a time as it is being endarterially positioned (261, ER §§VII-VIII).  |
|---|--|
| stent within the body in its deformed configuration,  | The $A_s$ in <b>Cragg II</b> is ~15° C (601-02; ER §§VII-VIII). When the filter is inserted into the body, the Nitinol filter rises above $A_s$ , causing the catheter to stress the filter and the filter to retain its SIM state (ER §§VII-VIII). This stress retains the filter in its deformed shape less than body temperature for a period of time while it is endarterially positioned (602; ER §§VII-VIII).  |
|   | The $A_s$ in <b>Miyauchi</b> is ~22° C (99; ER §§VII-VIII). Miyauchi discloses that, "[i]f the reverse transformation temperature is low, the manipulation tool 12 is cooled in advance, and during use it is immediately inserted into the tube-shaped path" (99). For the period of time from when the tool reaches its $A_s$ temperature and up to body temperature, the restraints holds the device in a deformed configuration below body temperature while the tool is positioned (99; ER §§VII-VIII). |
|   | The '212 patent teaches that because "the device will begin reforming around 70° F [21° C]," it is "important to keep the device always below 70° F before insertion into a uterus, or alternatively to keep the device in a container which will hold the deformed shape" (3:21-25). This discloses that the device is deformed while its temperature is below body temperature (ER §§VII-VIII).  |
|   | As noted, it would have been obvious to adapt the uses of shape-memory alloys as disclosed in <b>Miyauchi</b> and the <b>'212 patent</b> to endarterially place a stent in view of Cragg I (ER §§VII-VIII).  |
| the deformation occurring through the formation of  | Because the Nitinol coil wire in <b>Cragg I</b> is annealed, it has a M <sub>s</sub> temperature well below 0° C (261, ER §§VII-VIII). The deformation is thus due to SIM (261, ER §§VII-VIII).  |

# stress-induced martensite;

The filter in **Cragg II** has a Ms temperature well below 0° C (ER §§VII-VIII). The deformation is thus due to SIM (601; ER §§VII-VIII). Further, the stress of the catheter causes SIM when the Nitinol stent is repositioned within the body (601-02; ER §§VII-VIII).

Because A<sub>s</sub> is below body temperature and M<sub>s</sub> is below 0° C, the deformation in **Miyauchi** is through the formation of SIM (99; ER §§VII-VIII; *see also* Claim 1).

Because  $A_s$  is below body temperature and  $M_s$  below 0° C, the deformation in the '212 Patent is through the formation of SIM (3:21-25; ER §§VII-VIII; see also Claim 1).

wherein the stent is sufficiently deformed that when the stent is at human body temperature removal of the restraint from the stent, without change in temperature of the device, releases at least a portion of the stent from its deformed configuration.

**Cragg I** discloses that, when deployed from the catheter, the Nitinol transforms from its deformed to its unstressed configuration (261; ER §§VII-VIII). Because the Nitinol wire is released at body temperature, it undergoes this transformation without change in temperature of the device (261; ER §§VII-VIII).

**Cragg II** discloses that the temperature in the body is above the Nitinol filter's  $A_s$  temperature (602; ER §§VII-VIII). The filter thus transforms from a deformed, stressed shape to an unstressed shape without any change in temperature when it is released at body temperature from the catheter (ER §§VII-VIII).

**Miyauchi** discloses that its SMA does not require any change in temperature for the material to exhibit a pseudoelastic effect (99; ER §§VII-VIII). Because the A<sub>s</sub> temperature in Miyauchi is below body temperature, the manipulation tool transforms from a deformed shape to a usable shape when released within the body without change in temperature (99-100; ER §§VII-VIII).

The '212 patent discloses that the  $A_s$  is below body temperature (3:21-25). As such, the alloy transforms from a deformed SIM state to an austenitic, unstressed shape

|                       | above A <sub>s</sub> that occurs without change in temperature when       |
|-----------------------|---|
|                       | released at body temperature (3:21-25; ER §§VII-VIII).                    |
| 7. A device as        | The catheter (i.e., restraint) in <b>Cragg I</b> is hollow and the        |
| claimed in claim 6,   | wire coil is positioned within the catheter (261).                        |

The coil is deformed by its transverse dimension and prevented from expanding as shown in FIG. 4 (99; ER §§VII-VIII). As already noted, it would have been obvious to use a stent.  |
|---|--|
|   | The medical device disclosed in the '212 patent has a transverse (across) dimension and a longitudinal (length) dimension as shown in FIG. 7. When deformed (see FIG. 8), the transverse dimension is reduced and prevented from expanding by the cannula. As already noted, it would have been obvious to use a stent in view of Cragg I. |
| <b>10.</b> The device of claim 6, wherein the shape memory alloy  | The Teflon catheter in <b>Cragg I</b> does not exhibit a state change (262; ER §§VII-VIII).  |
| element is sufficiently deformed that   | The Teflon catheter in <b>Cragg II</b> does not exhibit a state change (602, ER §§VII-VIII).   |
| removal of the restraint from the shape memory alloy  | The endoscope in <b>Miyauchi</b> does not exhibit a state change (99; ER §§VII-VIII).  |
| releases at least a portion of the shape memory alloy element from its deformed configuration without change in state of the restraint. | The cannula in the '212 patent does not exhibit a state change (1:17-19; ER §§VII-VIII).   |
| <b>11.</b> A medical device suitable for  | Cragg I, Cragg II, Miyauchi and the '212 patent each disclose a medical device for insertion into and treatment  |
| placement within a  | of a human body (see Claim 1).   |
| mammalian body for treatment of the   |  |
| mammalian body,   |  |
| the device  |  |
| comprising:   | The sail stant in Cropp I is made from Niting 1.   |
| (a) a stent formed at least partly from a   | The coil stent in <b>Cragg I</b> is made from Nitinol, a pseudoelastic shape memory alloy (261, ER §§VII-VIII).  |
| pseudoelastic shape-  | pocuation shape memory andy (201, Lix gg v 11- v 111).   |

| memory alloy,  | The coil filter in <b>Cragg II</b> is made from Nitinol, a pseudoelastic shape memory alloy (601; ER §§VII-VIII).  |
|--|--|
|  | The manipulation tool in <b>Miyauchi</b> is made from a SMA that exhibits "'pseudoelasticity' or 'superelasticity'" (99; ER §§VII-VIII). It would have been obvious to utilize a stent in view of Cragg I (ER §§VII-VIII).   |
|  | The '212 patent discloses a Nitinol pseudoelastic SMA with an A <sub>s</sub> below body temperature (2:54-59; ER §§VII-VIII). It would have been obvious to utilize a stent in view of Cragg I (ER §§VII-VIII).  |
| the alloy having a<br>reversible stress-<br>induced martensitic<br>state and an  | The Nitinol disclosed in <b>Cragg I</b> displays a SIM state and an austenitic state above A <sub>s</sub> (261; ER §§VII-VIII; <i>see</i> Claims 1 and 6).   |
| austenitic state,  | The Nitinol filter in <b>Cragg II</b> displays a SIM state and an austenitic state above $A_s$ (602; ER §§VII-VIII; <i>see</i> Claims 1 and 6).  |
|  | <b>Miyauchi</b> discloses a pseudoelastic SMA that exhibits SIM and austenitic states above A <sub>s</sub> temperature (99; ER §§VII-VIII; <i>see</i> Claims 1 and 6).   |
|  | The <b>'212 patent</b> discloses a pseudoelastic SMA that exhibits stress-induced martensitic and austenitic states above A <sub>s</sub> (3:16-21; ER §§VII-VIII; <i>see</i> Claims 1 and 6).  |
| the memory alloy<br>element having (i) a<br>deformed shape<br>when the alloy is in<br>its stress-induced<br>martensitic state and<br>(ii) a different, | In <b>Cragg I</b> , the stent is deformed and drawn into a catheter, where it is stressed in a relatively straightened shape (262). When removed, the Nitinol takes the shape of a coil stent (262, FIG. 1). The catheter keeps the stent in a deformed SIM state (262; ER §§VII-VIII; <i>see also</i> Claim 1). |
| unstressed shape; and  | Cragg II discloses that the filter is straight when in its SIM state and coiled when in its unstressed austenitic state (602; ER §§VII-VIII).  |
|  | Miyauchi discloses that the manipulation tool has a "usable shape" when in its unstressed state and has a  |

|   | deformed SIM shape, <i>e.g.</i> , when removed "from the insertion hole" (99; ER §§VII-VIII).   |
|---|---|
|   | The '212 patent discloses that the contraceptive device has a "compact fold configuration" when in its SIM state and a "free shape" or "original shape" when in its unstressed austenitic state (3:2-11; ER §§VII-VIII).  |
| (b) restraining means engaging and stressing the stent at a temperature less than the body temperature of the mammal and greater than the A <sub>s</sub> of the | The A <sub>s</sub> in <b>Cragg I</b> is 25°C (262, ER §§VII-VIII). When the stent is inserted into the body, the Nitinol stent rises above A <sub>s</sub> , causing the catheter to stress the stent and retain SIM (262, ER §§VII-VIII). Thus, the temperature of the stent while restrained in the catheter is above A <sub>s</sub> but less than body temperature for a time as it is positioned within the body (262, ER §§VII-VIII; <i>see</i> Claim 6). |
| alloy for positioning<br>the stent within the<br>mammalian body<br>while the stent is in<br>its deformed shape;   | The $A_s$ in <b>Cragg II</b> is ~15° C (601-02; ER §§VII-VIII). When the filter is inserted into the body, the Nitinol filter rises above $A_s$ , causing the catheter to stress the filter and retain SIM (602; ER §§VII-VIII). Thus, the temperature of the filter while restrained is above $A_s$ but less than body temperature for a time as it is positioned within the body (602; ER §§VII-VIII; <i>see</i> Claim 6).                                  |
|   | The $A_s$ in <b>Miyauchi</b> is ~22° C (99; ER §§VII-VIII). For the period of time from when the tool reaches its $A_s$ temperature and prior to reaching body temperature, the restraint will hold the device in a deformed configuration below body temperature while the tool is positioned within the body (99; ER VII; <i>see</i> Claim 6).  |
|   | The '212 patent discloses that the self-expanding medical device will be in its deformed configuration for a time while its temperature is below body temperature but above its A <sub>s</sub> temperature when being positioned in the body (ER §§VII-VIII; see Claim 6).  |
| wherein the alloy is<br>selected so that<br>removal of the<br>restraining means<br>from the stent at a  | The A <sub>s</sub> temperature of the Nitinol wire in <b>Cragg I</b> is below body temperature. "As the coil is extruded from the catheter it reverts to its 'memorized' shape" ( <i>i.e.</i> , it transforms from its relatively straight shape to its coil shape) (262; ER §§VII-VIII; <i>see</i> Claim 1).   |

| temperature greater<br>than the As of the<br>alloy when the<br>device is placed<br>within the<br>mammalian body,<br>transforms at least a<br>portion of the alloy<br>from its stressed-<br>induced martensitic | Because $A_s$ is below body temperature in <b>Cragg II</b> , once the Nitinol is released from the catheter, it "rapidly resume[s] its original filter shape" (602; ER §§VII-VIII). This transforms at least a portion of the alloy from SIM to austenite (ER §§VII-VIII). Cragg II also discloses that the filter transforms from its SIM shape to its unstressed austenitic shape after repositioning (602; ER §§VII-VIII; see Claim 1). |
|--|--|
| state so that the stent<br>transforms from its<br>deformed relatively<br>straightened shape<br>towards its<br>unstressed relatively  | <b>Miyauchi</b> discloses deploying the SMA device from the endoscope at a temperature that is greater than the A <sub>s</sub> temperature of the tool (99; ER §§VII-VIII). Doing so causes a transformation from SIM to austenite (99; ER §§VII-VIII; <i>see</i> Claim 1).  |
| coiled shape,  | The '212 patent discloses that the A <sub>s</sub> of the device is below body temperature (3:21-25; ER §§VII-VIII). When extended from the cannula at body temperature, the device transforms from SIM to austenite (ER §§VII-VIII).   |
| without any change<br>in temperature of the<br>restraining means or<br>the stent being<br>required for the   | The Nitinol in <b>Cragg I</b> does not require any change in the temperature of the catheter or the stent in order for the stent to transform from SIM to austenite when released inside the body (261-62; ER §§VII-VIII; <i>see</i> Claim 1).   |
| transformation of the alloy.   | The Nitinol coil in <b>Cragg II</b> does not require any change in temperature of the catheter or the stent in order for the stent to transform from SIM to austenite when released inside the body (601-02; ER §§VII-VIII; <i>see</i> Claim 1).   |
|  | <b>Miyauchi</b> discloses that its SMA does not require any change in temperature for the material to change from SIM to austenite in the body (99; ER §§VII-VIII; <i>see</i> Claim 1).  |
|  | The '212 patent discloses an SMA that does not require a change in temperature to transform from a deformed SIM state to an austenitic shape inside the body (3:21-25; ER §§VII-VIII; see Claim 1).  |
| <b>12.</b> The device of claim 11, wherein   | The Teflon catheter in <b>Cragg I</b> does not exhibit a state change (262; ER §§VII-VIII).  |

| the transformation of the alloy occurs without any change in the state of the | The Teflon catheter in <b>Cragg II</b> does not exhibit a state change (602, ER §§VII-VIII).   |
|---|--|
| restraining means.  | The endoscope in <b>Miyauchi</b> does not exhibit a state change (99; ER §§VII-VIII).  |
|   | The cannula in the '212 patent does not exhibit a state change (1:17-19; ER §§VII-VIII).   |
| <b>13.</b> The device of claim 11 wherein the                                 | The restraining means in <b>Cragg I</b> is a catheter (261).   |
| restraining means is a catheter.  | The restraining means in <b>Cragg II</b> is a catheter (601).  |
|   | It would have been obvious to utilize a catheter in <b>Miyauchi</b> in view of Cragg I (ER §§VII-VIII).  |
|   | The cannula in the '212 patent is the same as a catheter (Exhibit 1001 at 5:61-62).  |
| 14. The device of claim 13 wherein the stent is within the                    | The catheter in <b>Cragg I</b> is hollow and the wire coil is positioned within the catheter (261).  |
| catheter.   | The catheter in <b>Cragg II</b> is hollow and the wire coil is positioned within the catheter (601).   |
|   | The endoscope in <b>Miyauchi</b> is hollow and the device is positioned therein. It would have been obvious to use a stent in view of Cragg I (ER §§VII-VIII).             |
|   | The cannula in the '212 patent is hollow and the device is positioned therein (3:16-29). It would have been obvious to utilize a stent in view of Cragg I (ER §§VII-VIII). |
| 15. A medical   | Cragg I, Cragg II, Miyauchi and the '212 patent each   |
| device for treatment  | disclose a medical device for insertion into and treatment   |
| of a mammalian  | of a human body (see Claim 1).   |
| body, the device  |  |
| comprising:   |  |
| (a) a memory alloy  | The coil stent in <b>Cragg I</b> is made from Nitinol, a   |
| stent formed at least   | pseudoelastic SMA (261, ER §§VII-VIII).  |
| partly from a pseudoelastic shape-  | The coil filter in Crass II is made from Niting!   |
| pseudociastic sitape-   | The coil filter in <b>Cragg II</b> is made from Nitinol, a   |

| memory alloy,  | pseudoelastic SMA (601; ER §§VII-VIII).   |
|--|---|
|  | The manipulation tool in <b>Miyauchi</b> is made from a SMA that exhibits "'pseudoelasticity' or 'superelasticity'" (99; ER §§VII-VIII). As previously noted, it would have been obvious to utilize a stent in view of Cragg I.   |
|  | The '212 patent discloses a pseudoelastic SMA with an A <sub>s</sub> below body temperature (2:54-59; ER §§VII-VIII). As already noted, it would have been obvious to utilize a stent using the teachings of the '212 Patent in view of Cragg I.  |
| the alloy displaying reversible stress-induced martensite at about the   | At body temperature (above A <sub>s</sub> ), the Nitinol stent in <b>Cragg I</b> displays SIM and austenitic states (261; ER §§VII-VIII; <i>see</i> Claims 1 and 6).  |
| mammalian body<br>temperature such<br>that it has a stress-<br>induced martensitic   | At body temperature (above A <sub>s</sub> ), the Nitinol filter in <b>Cragg II</b> displays SIM and austenitic states (602; ER §§VII-VIII; <i>see</i> Claims 1 and 6).  |
| state and an austenitic state,   | <b>Miyauchi</b> discloses a SMA that exhibits SIM and austenitic states at about body temperature (which is above A <sub>s</sub> ) (99; ER §§VII-VIII; <i>see</i> Claims 1 and 6).  |
|  | The '212 patent discloses a SMA that exhibits SIM and austenitic states at about body temperature (above A <sub>s</sub> ) (3:16-21; ER §§VII-VIII; see Claims 1 and 6).   |
| the memory alloy<br>stent having (i) a<br>deformed relatively<br>straightened shape<br>when the alloy is in<br>its stress-induced<br>martensitic state and<br>(ii) a different | In <b>Cragg I</b> , the stent is deformed and drawn into a catheter, where it is stressed in a relatively straightened shape (262). When removed from the catheter, the Nitinol takes the shape of a coil stent (262, FIG. 1). The catheter keeps the stent in a SIM state while the Nitinol is constrained within the catheter (262; ER §§VII-VIII; <i>see</i> Claim 1). |
| unstressed relatively coiled shape;  | Cragg II discloses that the filter is straight when constrained in the catheter in its SIM state and coiled when in its unstressed austenitic state (602; ER §§VII-VIII).   |
|  | Miyauchi discloses that the manipulation tool has a   |

|  | "usable shape" when in its unstressed state and has a deformed SIM shape, <i>e.g.</i> , when removed "from the insertion hole" (99; ER §§VII-VIII).  |
|--|--|
|  | The '212 patent discloses that the contraceptive device has a "compact fold configuration" when in its SIM state and a "free shape" or "original shape" when in its unstressed austenitic state (3:2-11; ER §§VII-VIII). |
| (b) a hollow restraining member with the memory  | Cragg I discloses a catheter (i.e., restraining member) with the stent being placed therein (261).   |
| alloy stent being within the restraining member, | The catheter in <b>Cragg II</b> is hollow and the wire coil is positioned therein (601).   |
|  | The endoscope in <b>Miyauchi</b> is hollow and the device is positioned therein (99). It would have been obvious to utilize a stent in view of Cragg I (ER §§VII-VIII).  |
|  | The cannula in the '212 Patent is hollow and the device is positioned therein (3:16-29). It would have been obvious to utilize a stent in view of Cragg I (ER §§VII-VIII).   |
| the restraining                                  | The A <sub>s</sub> in <b>Cragg I</b> is 25°C (262, ER §§VII-VIII). When  |
| member engaging                                  | the stent is inserted into the body, the Nitinol stent rises   |
| and stressing the                                | above A <sub>s</sub> , causing the catheter to stress the stent and retain   |
| memory alloy stent                               | SIM (262, ER §§VII-VIII). Thus, the temperature of the   |
| at a temperature less than the body              | stent while restrained in the catheter is above A <sub>s</sub> but less than body temperature for a time as it is positioned within  |
| temperature of the mammal and greater            | the body (262, ER §§VII-VIII; see Claims 6 and 11).  |
| than the A <sub>s</sub> of the                   | The $A_s$ in Cragg II is ~15° C (601-02; ER §§VII-VIII).   |
| alloy for positioning                            | When the filter is inserted into the body, the Nitinol filter  |
| the memory alloy                                 | rises above A <sub>s</sub> , causing the catheter to stress the filter and   |
| stent within the                                 | retain SIM (602; ER §§VII-VIII). Thus, the temperature of  |
| human body while                                 | the filter while restrained is above A <sub>s</sub> but less than body   |
| the memory alloy coil stent is in its            | temperature for a time as it is positioned within the body   |
| deformed relatively                              | (602; ER §§VII-VIII; see Claims 6 and 11).   |
| straightened shape;                              | The $A_s$ in <b>Miyauchi</b> is ~22° C (99; ER §§VII-VIII). For  |
|  | the period of time from when the tool reaches its $A_s$  |
|  | temperature and prior to reaching body temperature, the  |

|                                | restraint will hold the device in a deformed configuration              |
|--------------------------------|---|
|                                | below body temperature while the tool is positioned within              |
|                                | the body (99; ER VII; see Claims 6 and 11).                             |
|                                |   |
|                                | The '212 patent discloses that the self-expanding medical               |
|                                | device will be in its deformed configuration for a time                 |
|                                | while its temperature is below body temperature but above               |
|                                | its $A_s$ temperature when being positioned in the body (ER             |
|                                | §§VII-VIII; see Claims 6 and 11).                                       |
| wherein the                    | The A <sub>s</sub> temperature of the Nitinol wire in <b>Cragg I</b> is |
| restraining member             | below body temperature. "As the coil is extruded from the               |
| and the memory                 | catheter it reverts to its 'memorized' shape" (i.e., it                 |
| alloy stent are                | transforms from its relatively straight shape to its coil               |
| movable relative to            | shape) (262; ER §§VII-VIII; see Claim 1).                               |
| each other to                  |   |
| transform at least a           | Because $A_s$ is below body temperature in <b>Cragg II</b> , once       |
| portion of the alloy           | the stent is released from the catheter, it "rapidly                    |
| from its stress-               | resume[s] its original filter shape" (602; ER §§VII-VIII).              |
| induced martensitic            | This transforms at least a portion of the alloy from SIM to             |
| state at a                     | austenite (ER §§VII-VIII). Similarly, Cragg II discloses                |
| temperature greater            | that the filter transforms from its deformed, SIM shape to              |
| than the A <sub>s</sub> of the | its unstressed austenitic shape after repositioning (602; ER            |
| alloy so that the              | §§VII-VIII; see Claim 1).   |
| memory alloy                   |   |
| element transforms             | Miyauchi discloses deploying the SMA device from the                    |
| from its deformed              | endoscope at a temperature greater than the $A_s$ temperature           |
| shape towards its              | of the device (99; ER §§VII-VIII). Doing so causes a                    |
| unstressed relatively          | transformation from SIM to austenite (99; ER §§VII-VIII;                |
| coiled shape,                  | see Claim 1).   |
|                                |   |
|                                | The '212 patent discloses that the $A_s$ of the contraceptive           |
|                                | device is well below body temperature (3:21-25; ER                      |
|                                | §§VII-VIII). Thus, when extended from the cannula, the                  |
|                                | device transforms from SIM to austenite (ER §§VII-VIII).                |
| and wherein the                | The SMA selected in <b>Cragg I</b> can change from SIM to               |
| alloy is selected so           | austenite when released in the body without change in                   |
| that the                       | temperature (261-62; ER §§VII-VIII; see Claim 1).                       |
| transformation can             |   |
| occur without any              | The SMA selected in <b>Cragg II</b> can transform from SIM to           |
| change in                      | austenite when released in the body without change in                   |

| temperature of the restraining member | temperature (601-02; ER §§VII-VIII; see Claim 1).   |
|---------------------------------------|---|
| of the memory alloy                   | The SMA selected in <b>Miyauchi</b> can transform from SIM  |
| element.                              | to austenite when released in the body without change in  |
|                                       | temperature (99; ER §§VII-VIII; see Claim 1).   |
|                                       |   |
|                                       | The SMA selected in the '212 patent can transform from  |
|                                       | SIM to austenite when released in the body without  |
|                                       | change in temperature (3:21-25; ER §§VII-VIII; see Claim  |
|                                       | 1).   |
| 16. A medical                         | Cragg I, Cragg II, Miyauchi and the '212 patent each  |
| device suitable for                   | disclose a medical device for insertion into and treatment  |
| placement within a                    | of a human body (see Claim 1).  |
| mammalian body for                    |   |
| treatment of the                      |   |
| mammalian body,<br>the device         | Cragg I discloses a catheter with a deformed Nitinol coil   |
| comprising (i) a                      | being placed therein (261). The Nitinol coil is a   |
| restraint, and (ii) a                 | pseudoelastic SMA (261; ER §§VII-VIII).   |
| coil stent formed at                  | pseudoclastic Siviri (201, Elt gg v II v III).  |
| least partly from a                   | Cragg II discloses a catheter with a deformed Nitinol coil  |
| pseudoelastic shape-                  | being placed therein (601). The filter in Cragg II is made  |
| memory alloy,                         | from Nitinol, a pseudoelastic SMA (601; ER §§VII-VIII).   |
|                                       |   |
|                                       | The manipulation tool in <b>Miyauchi</b> is constrained within  |
|                                       | an endoscope and made from a SMA that exhibits  |
|                                       | "'pseudoelasticity'" (99; ER §§VII-VIII). As discussed, it  |
|                                       | would have been obvious to use a stent in view of Cragg I.  |
|                                       | TI 1010 ( CMA   |
|                                       | The '212 patent discloses a Nitinol pseudoelastic SMA   |
|                                       | with an A <sub>s</sub> below body temperature constrained within a  |
|                                       | cannula (2:54-59; ER §§VII-VIII). As discussed, it would have been obvious to utilize a stent in view of Cragg I. |
| the alloy displaying                  | The catheter in <b>Cragg I</b> holds the wire coil in a deformed  |
| reversible stress-                    | configuration (262; ER §§VII-VIII). The A <sub>s</sub> temperature  |
| induced martensite                    | for the Nitinol is below body temperature, the $M_s$  |
| by being above its                    | temperature is less than 0° C, and the M <sub>d</sub> temperature is  |
| $A_s$ and above its $M_s$             | approximately 150° C (ER §§VII-VIII). At body   |
| and below its M <sub>d</sub> at       | temperature, the SMA displays reversible SIM by being   |
| about body                            | above its $M_s$ and $A_s$ and below its $M_d$ temperature (ER   |

| temperature;  | §§VII-VIII).   |
|---|--|
|   | The catheter in <b>Cragg II</b> holds the wire coil in a deformed configuration (601-02; ER $\S$ VII-VIII). The $A_s$ temperature is below body temperature, the $M_s$ temperature is less than 0° C, and the $M_d$ temperature is $\sim$ 150° C (ER $\S$ VII-VIII). At body temperature, the alloy displays reversible SIM by being above its $M_s$ and $A_s$ and below its $M_d$ temperature (ER $\S$ VII-VIII). |
|   | <b>Miyauchi</b> discloses stressing the manipulation tool above the A <sub>s</sub> temperature of the SMA during insertion into the body (99; ER §§VII-VIII). The M <sub>s</sub> temperature is below body temperature, and the M <sub>d</sub> temperature is above body temperature (ER §§VII-VIII). Thus, the SMA displays reversible SIM at about body temperature (ER §§VII-VIII).                             |
|   | In the <b>'212 patent</b> , the temperature of the device exceeds the A <sub>s</sub> of the device upon insertion into the body (3:2-8; ER §§VII-VIII). Body temperature is above M <sub>s</sub> and below M <sub>d</sub> for the SMA disclosed in the '212 patent, thus providing for reversible SIM at about body temperature (ER §§VII-VIII).   |
| such that it has a<br>stress-induced<br>martensitic state and<br>an austenitic state, | Above its A <sub>s</sub> temperature, the Nitinol in <b>Cragg I</b> displays a SIM state and an austenitic state (261; ER §§VII-VIII; <i>see</i> Claim 1).   |
| ,   | Above its A <sub>s</sub> temperature, the Nitinol in <b>Cragg II</b> displays a SIM state and an austenitic state (602; ER §§VII-VIII; see Claim 1).   |
|   | <b>Miyauchi</b> discloses a pseudoelastic SMA that exhibits SIM and austenitic states above its A <sub>s</sub> temperature (99; ER §§VII-VIII; <i>see</i> Claim 1).  |
|   | The <b>'212 patent</b> discloses a pseudoelastic SMA that exhibits SIM and austenitic states above its A <sub>s</sub> temperature (3:16-21; ER §§VII-VIII; <i>see</i> Claim 1).  |
| the element having  | In Cragg I, the stent is deformed and drawn into a catheter,   |

(i) a relatively straightened shape when the alloy is in its stress-induced martensitic state and (ii) a different relatively coiled shape; where it is stressed in a relatively straightened shape (262). When removed from the catheter, the Nitinol takes the shape of a coil stent (262, FIG. 1). The catheter keeps it in a SIM state while the Nitinol is constrained within the catheter (262; ER §§VII-VIII; see Claim 1).

**Cragg II** discloses that the filter is relatively straight when in its SIM state and coiled when in its unstressed austenitic state (602; ER §§VII-VIII).

**Miyauchi** discloses that the manipulation tool has a "usable shape" of a coil when in its austenitic state and a linear, relatively straight shape when deformed by SIM in the endoscope (99, FIG. 3; ER §§VII-VIII).

The '212 patent discloses that the contraceptive device has a "compact fold configuration" when in its SIM state and a "free shape" or "original shape" when in its unstressed austenitic state (3:2-11; ER §§VII-VIII).

wherein the restraint is (i) stressing the coil stent at a temperature less than the body temperature of the mammal for placement of the coil stent in its relatively straightened shape in the mammalian body and

The  $A_s$  in **Cragg I** is 25°C (262, ER §§VII-VIII). When the stent is inserted into the body, the Nitinol stent rises above  $A_s$ , causing the catheter to stress the stent and retain SIM (262, ER §§VII-VIII). Thus, the temperature of the stent while restrained in the catheter is above  $A_s$  but less than body temperature for a time as it is positioned (262, ER §§VII-VIII; *see* Claims 6, 11, and 15).

The  $A_s$  in **Cragg II** is ~15° C (601-02; ER §§VII-VIII). When the filter is inserted into the body, the Nitinol filter rises above  $A_s$ , causing the catheter to stress the filter and retain SIM (602; ER §§VII-VIII). Thus, the temperature of the filter while restrained is above  $A_s$  but less than body temperature for a time as it is positioned within the body (602; ER §§VII-VIII; *see* Claims 6, 11, and 15).

The  $A_s$  in **Miyauchi** is ~22° C (99; ER §§VII-VIII). For the period of time from when the tool reaches its  $A_s$  temperature and prior to reaching body temperature, the restraint will hold the device in a deformed configuration below body temperature while the tool is positioned within

|   | the body (99; ER VII; see Claims 6, 11, and 15).  |
|---|---|
|   | The <b>'212 patent</b> discloses that the self-expanding medical device will be in its deformed configuration for a time while its temperature is below body temperature but above its A <sub>s</sub> temperature when being positioned in the body (ER §§VII-VIII; <i>see</i> Claims 6, 11, and 15).   |
| (ii) is capable of<br>being at least<br>partially removed<br>from the coil stent<br>while the coil stent<br>is within the body at<br>the body<br>temperature and the<br>coil stent is therefore | The A <sub>s</sub> temperature of the wire in <b>Cragg I</b> is below body temperature. "As the coil is extruded from the catheter it reverts to its 'memorized' shape" ( <i>i.e.</i> , it transforms from its relatively straight shape to its coil shape) (262; ER §§VII-VIII). This operating temperature at release ( <i>i.e.</i> , body temperature) is greater than the A <sub>s</sub> and M <sub>s</sub> temperatures and below the M <sub>d</sub> temperature (ER §§VII-VIII; <i>see</i> Claims 1 and 6). |
| at an operating temperature greater than the $A_s$ and $M_s$ and below the $M_d$ of the alloy,  | Because A <sub>s</sub> is below body temperature in <b>Cragg II</b> , once the filter is released from the catheter, it "rapidly resume[s] its original filter shape" (602; ER §§VII-VIII). This operating temperature at release ( <i>i.e.</i> , body temperature) is greater than the A <sub>s</sub> and M <sub>s</sub> temperatures and below the M <sub>d</sub> temperature (ER §§VII-VIII; <i>see</i> Claims 1 and 6).   |
|   | Miyauchi discloses deploying the SMA at body temperature (99; ER §§VII-VIII). This operating temperature for the transformation ( <i>i.e.</i> , body temperature) is greater than the A <sub>s</sub> and M <sub>s</sub> temperatures and below the M <sub>d</sub> temperature (ER §§VII-VIII; <i>see</i> Claims 1 and 6).  The '212 patent discloses deploying the SMA at body  |
|   | temperature (3:21-25; ER VII). This operating temperature for the transformation ( <i>i.e.</i> , body temperature) is greater than the A <sub>s</sub> and M <sub>s</sub> temperatures and below the M <sub>d</sub> temperature (ER §§VII-VIII; <i>see</i> Claims 1 and 6).  |
| such removal of the restraint causing at least a portion of the of the alloy to transform from its  | The A <sub>s</sub> temperature of the Nitinol wire in <b>Cragg I</b> is below body temperature. "As the coil is extruded from the catheter it reverts to its 'memorized' shape" ( <i>i.e.</i> , it transforms from its relatively straight shape to its coil shape) (262; ER §§VII-VIII; <i>see</i> Claim 1).   |

| stress-induced          |
|-------------------------|
| martensitic state to    |
| its austenitic state so |
| that the coil stent     |
| spontaneously           |
| transforms from its     |
| relatively              |
| straightened shape      |
| towards its relatively  |
| coiled shape,           |
| _                       |
|                         |
|                         |
|                         |
|                         |
|                         |

Because A<sub>s</sub> is below body temperature in **Cragg II**, once the stent is released from the catheter, it "rapidly resume[s] its original filter shape" (602; ER §§VII-VIII). This transforms at least a portion of the alloy from SIM to austenite (ER §§VII-VIII). Similarly, Cragg II discloses that the filter transforms from its deformed, SIM shape to its unstressed austenitic shape after repositioning (602; ER §§VII-VIII; *see* Claim 1).

**Miyauchi** discloses deploying the SMA device from the endoscope at a temperature greater than the A<sub>s</sub> temperature of the device (99; ER §§VII-VIII). Doing so causes a transformation from SIM to austenite (99; ER §§VII-VIII; *see* Claim 1).

The '212 patent discloses that the  $A_s$  of the contraceptive device is well below body temperature (3:21-25; ER  $\S$ VII-VIII). Thus, when extended from the cannula, the device transforms from SIM to austenite (ER  $\S$ VII-VIII).

and such transformation can occur without a change in temperature of the restraint or of the coil stent from the operating temperature. The SMA selected in **Cragg I** can change from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (261-62; ER §§VII-VIII; *see* Claim 1).

The SMA selected in **Cragg II** can transform from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (601-02; ER §§VII-VIII; *see* Claim 1).

The SMA selected in **Miyauchi** can transform from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (99; ER §§VII-VIII; *see* Claim 1).

The SMA selected in the '212 patent can transform from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (3:21-25; ER §§VII-VIII; see Claim 1).

### 17. The device of

Cragg I, Cragg II, Miyauchi and the '212 patent each

| memory alloy,                     | pseudoelastic SMA (601; ER §§VII-VIII).                             |
|                                   | The manipulation tool in <b>Miyauchi</b> is made from a SMA         |
|                                   | that has "'pseudoelasticity'" (99; ER §§VII-VIII). As               |
|                                   | previously discussed, it would have been obvious to utilize         |
|                                   | a stent in view of Cragg I.   |
|                                   | a stelle in view of chagg i.  |
|                                   | The '212 patent discloses a Nitinol pseudoelastic SMA               |
|                                   | with an $A_s$ below body temperature (2:54-59). As                  |
|                                   | previously discussed, it would have been obvious to use a           |
|                                   | stent in view of Cragg I.   |
| the alloy displaying              | At body temperature (above A <sub>s</sub> ), the Nitinol stent in   |
| reversible stress-                | Cragg I displays SIM and austenitic states (261; ER                 |
| induced martensite                | §§VII-VIII; see Claims 1 and 6).                                    |
| at about human body               |   |
| temperature                       | At body temperature (above A <sub>s</sub> ), the Nitinol filter in  |
|                                   | Cragg II displays SIM and austenitic states (602; ER                |
|                                   | §§VII-VIII; see Claims 1 and 6).                                    |
|                                   | Miyauchi discloses a SMA that exhibits SIM and                      |
|                                   | austenitic states at about body temperature (which is above         |
|                                   | A <sub>s</sub> ) (99; ER §§VII-VIII; see Claims 1 and 6).           |
|                                   |   |
|                                   | The '212 patent discloses a SMA that exhibits SIM and               |
|                                   | austenitic states at about body temperature (above A <sub>s</sub> ) |
|                                   | (3:16-21; ER §§VII-VIII; see Claims 1 and 6).                       |
| such as it has a                  | In <b>Cragg I</b> , the stent is deformed and drawn into a          |
| deformed shape                    | catheter, where it is stressed in a relatively straightened         |
| when the alloy is in              | shape (262). When removed from the catheter, the Nitinol            |

its stress-induced martensitic state and a different unstressed shape when the alloy is in its austenitic state; and takes the shape of a coil stent (262, FIG. 1). The catheter keeps the stent in a SIM state while the Nitinol is constrained within the catheter (262; ER §§VII-VIII; see Claim 1).

**Cragg II** discloses that the filter is straight when constrained in the catheter in its SIM state and coiled when in its unstressed austenitic state (602; ER §§VII-VIII).

**Miyauchi** discloses that the manipulation tool has a "usable shape" when in its unstressed state and has a deformed SIM shape, *e.g.*, when removed "from the ... insertion hole" (99; ER §§VII-VIII).

The '212 patent discloses that the contraceptive device has a "compact fold configuration" when in its SIM state and a "free shape" or "original shape" when in its unstressed austenitic state (3:2-11; ER §§VII-VIII).

(b) a restraint stressing the wire stent at a temperature greater than the  $A_s$  of the alloy so that the wire stent is in its deformed shape,

The A<sub>s</sub> in **Cragg I** is 25°C (262, ER §§VII-VIII). When the stent is inserted, the Nitinol stent rises above A<sub>s</sub>, causing the catheter to stress the stent (262, ER §§VII-VIII). The catheter retains the stent in its deformed shape (262; ER §§VII-VIII).

The  $A_s$  in **Cragg II** is ~15° C (601-02; ER §§VII-VIII). When the filter is inserted, the Nitinol filter rises above  $A_s$ , causing the catheter to stress the filter and retain its deformed shape (602; ER VII). Additionally, the catheter stresses the filter above  $A_s$  when the filter is repositioned by being pulled into the catheter (602; ER §§VII-VIII).

The  $A_s$  in **Miyauchi** is ~22° C (99; ER §§VII-VIII). When the manipulation tool is within the endoscope, and the temperature is above  $A_s$ , the stress by the endoscope on the manipulation tool causes the tool to be deformed through SIM (99; ER §§VII-VIII).

The '212 patent discloses that the  $A_s$  of the contraceptive device is 21° C (3:21-25; ER §§VII-VIII). Thus, the

|  | cannula stresses the device and keeps it in a deformed shape during insertion in the body (3:2-8; ER §§VII-VIII).  |
|--|--|
| wherein the stent<br>can be disengaged<br>from the restraint<br>upon placement in a<br>human so that the | The A <sub>s</sub> temperature of the wire in <b>Cragg I</b> is below body temperature. "As the coil is extruded from the catheter," it transforms from its relatively straight shape to its coil shape) (262; ER §§VII-VIII; <i>see</i> Claim 1).   |
| stent transforms<br>from its deformed<br>shape to its<br>unstressed shape,<br>and                        | Because A <sub>s</sub> is below body temperature in <b>Cragg II</b> , when s released from the catheter, the filter transforms at least a portion of the alloy from SIM to austenite, "rapidly resum[ing] its original filter shape" (602; ER §§VII-VIII). Similarly, Cragg II discloses that the filter transforms from its deformed SIM shape to its unstressed austenitic shape during repositioning (602; ER VII; <i>see</i> Claim 1). |
|  | <b>Miyauchi</b> discloses deploying the SMA device from the endoscope at a temperature that is greater than the A <sub>s</sub> temperature of the device (99; ER §§VII-VIII). Doing so causes a transformation from deformed SIM to unstressed austenite (99; ER §§VII-VIII; see Claim 1).   |
|  | The <b>'212 patent</b> discloses that the A <sub>s</sub> of the contraceptive device is well below body temperature (3:21-25; ER §§VII-VIII). When extended from the cannula, the device transforms from SIM to austenite (ER §§VII-VIII; <i>see</i> Claim 1).   |
| wherein the alloy is<br>selected so that the<br>transformation can<br>occur without any<br>change in     | The SMA selected in <b>Cragg I</b> can change from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (261-62; ER §§VII-VIII; <i>see</i> Claim 1).   |
| temperature of the restraint or the wire stent.  | The SMA selected in <b>Cragg II</b> can transform from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (601-02; ER §§VII-VIII; <i>see</i> Claim 1).   |
|  | The SMA selected in <b>Miyauchi</b> can transform from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (99; ER §§VII-VIII; <i>see</i> Claim 1).   |

|   | 1  |
|---|--|
|   | The SMA selected in the '212 patent can transform from SIM to austenite when released at body temperature (the operating temperature) without change in temperature (3:21-25; ER §§VII-VIII; see Claim 1). |
| <b>19.</b> The device of claim 6, 11, 15, 16 or 18, including a   | <b>Cragg I</b> discloses that its Nitinol coil is "fastened to a threaded guiding wire to allow accurate placement" (261).   |
| guide wire for endarterial placement of the                       | The wire coil filter in <b>Cragg II</b> is endarterially placed by a guide wire (602).   |
| stent.  | With regard to <b>Miyauchi</b> and the '212 patent, as previously noted, it would have been obvious to deploy a self-expanding stent through the use of a catheter and guide wire (ER §§VII-VIII).         |
| 20. The device of claim 15, 16, or 18, wherein the                | The Teflon catheter in <b>Cragg I</b> does not exhibit a state change (262; ER §§VII-VIII).  |
| transformation of<br>the alloy occurs<br>without any change       | The Teflon catheter in <b>Cragg II</b> does not exhibit a state change (602, ER §§VII-VIII).   |

|   | The cannula in the '212 patent does not exhibit a state change (1:17-19; ER §§VII-VIII).   |
| 21. The device of claim 1, 15, 16, or 18, wherein the             | As noted, the restraint in <b>Cragg I</b> and <b>Cragg II</b> is a hollow catheter.  |
| restraint is a catheter.  | It would have been obvious to use a catheter in <b>Miyauchi</b> in view of Cragg I (ER §§VII-VIII).  |
|   | The cannula in the '212 Patent is the same as a catheter (Exhibit 1001 at 5:61-62).  |
| <b>22.</b> The device of claim 1, 11, 15, or 18 wherein the stent | <b>Cragg I</b> discloses using the Nitinol coil wire as a coil stent (262).  |
| is a coil stent.  | <b>Cragg II</b> discloses a Nitinol wire coil graft, which can be used as a coil stent to maintain vessel patency (or it would have been obvious to do so in view of Cragg I) (601; ER                     |

§§VII-VIII).

**Miyauchi** discloses a SMA device having a coiled structure similar to the stent of Cragg I in FIGS. 3(A)-3(C). As noted, it would have would have been obvious to alter Miyauchi to deploy a coil stent in view Cragg I (ER §§VII-VIII).

As noted, it would have would have been obvious to modify the '212 patent to deploy a coil stent in view of Cragg I (ER §§VII-VIII).

# f. Claims 1-22 are invalid for obviousness-type double patenting in view of the Jervis '378 Patent

The Petitioner also requests invalidation of the '141 Patent Claims for obviousness-type double patenting in view of the Jervis '378 patent. The '378 patent expired on May 19, 2004 by operation of a terminal disclaimer ('378 History (Exhibit 1033), Terminal Disclaimer dated March 14, 1995). The '141 Patent issued on October 23, 2001. The nominal term of the '141 Patent extends for seventeen years from issuance (i.e., to October 23, 2018) and has been extended under 35 U.S.C. §156 for an additional 1,270 days (i.e., until April 15, 2022) ('141 History (Exhibit 1025), Patent Term Extension Certificate, July 5, 2011). The '141 Patent and the '378 patent are commonly assigned to Medtronic, Inc. and both patents have the same sole inventor. Because the IPR Claims are obvious variants of claims in the 378 patent, and because the '141 Patent is not subject to safe harbor under 35 U.S.C. §121, an extension of the '141 Patent term beyond May 19, 2004 is improper.

A later claim that is not patentably distinct from an earlier claim in a commonly owned patent is invalid for obviousness-type double patenting. *Eli Lilly* & Co. v. Barr Labs., 251 F.3d 955, 968 (Fed. Cir. 2001). Where a later claim is obvious over, or anticipated by, an earlier claim, the later claim is not patentably distinct. *Id.* As detailed in the following claim chart, the '141 Patent Claims are not patentably distinct from the claims of the '378 patent. Moreover, any differences are obvious variations of the '378 patent claims based on prior art references, including *inter alia* Dotter (Exhibit 1009) and Cragg I (Exhibit 1004) (ER §VII.E. (opining that the '141 Patent Claims are obvious in view of the '378 patent)):

| '141 Patent Claim 1                           | '378 Patent Claim 34                         |

|---|---|
| '141 Patent Claim 11  | '378 Patent Claim 10  |
| 11. A medical device suitable for placement within a mammalian body for treatment of the mammalian body, the device comprising: (a) a stent formed at least partly from a pseudoelastic shape-memory alloy, the alloy having a reversible stress-induced martensitic state and an austenitic state,  the memory alloy element having (i) a deformed shape when the alloy is in its stress-induced martensitic state and (ii) a different, unstressed shape; and | a mammalian body, the device comprising: (a) a memory alloy element formed at least partly from a pseudoelastic shape memory alloy, the alloy displaying reversible stress-induced martensite at about body temperature such that it has a stress-induced martensitic state and an austenitic state,  the memory alloy element having (i) a deformed shape when the alloy is in its stress-induced martensitic shape and (ii) a different unstressed shape; and |
| (b) restraining means engaging and stressing the stent at a temperature less than the body temperature of the mammal and greater than the A <sub>s</sub> of the alloy for positioning the stent within the mammalian body while the stent is in its deformed shape;   | (b) a hollow restraining member with the memory alloy element being within the restraining member, the restraining member engaging and stressing the memory alloy element at a temperature less than the body temperature of the human and greater than the A <sub>s</sub> of the alloy for positioning the memory alloy element within or in proximity to the mammalian body while the memory alloy element is in its deformed shape;                          |
| wherein the alloy is selected so that removal of the restraining means from the stent at a temperature greater than the $A_s$ of the alloy when   | wherein the restraining member and<br>the memory alloy element are<br>movable relative to each other to<br>transform at least a portion of the  |

the device is placed within the mammalian body, transforms at least a portion of the alloy from its stressed-induced martensitic state so that the stent transforms from its deformed relatively straightened shape towards its unstressed relatively coiled shape, without any change in temperature of the restraining means or the stent being required for the transformation of the alloy.

alloy from its stress-induced martensitic state at a temperature greater than the  $A_s$  of the alloy so that the memory alloy element transforms from its deformed shape toward its unstressed shape, and wherein the alloy is selected so that the transformation can occur without any change in temperature of the restraining member or the memory alloy element.

# '141 Patent Claim 15

### '378 Patent Claim 10

15. A medical device for treatment of a mammalian body, the device comprising: (a) a memory alloy stent formed at least partly from a pseudoelastic shape-memory alloy, the alloy displaying reversible stress-induced martensite at about the mammalian body temperature such that it has a stress-induced martensitic state and an austenitic state,

10. A medical device for treatment of a mammalian body, the device comprising: (a) a memory alloy element formed at least partly from a pseudoelastic shape memory alloy, the alloy displaying reversible stress-induced martensite at about body temperature such that it has a stress-induced martensitic state and an austenitic state,

the memory alloy stent having (i) a deformed relatively straightened shape when the alloy is in its stressinduced martensitic state and (ii) a different unstressed relatively coiled shape; the memory alloy element having (i) a deformed shape when the alloy is in its stress-induced martensitic shape and (ii) a different unstressed shape; and

(b) a hollow restraining member with the memory alloy stent being within the restraining member, the restraining member engaging and stressing the memory alloy stent at a temperature less than the body temperature of the mammal and greater than the A<sub>s</sub> of the alloy for positioning the memory alloy stent

(b) a hollow restraining member with the memory alloy element being within the restraining member, the restraining member engaging and stressing the memory alloy element at a temperature less than the body temperature of the human and greater than the A<sub>s</sub> of the alloy for positioning the memory alloy element within or in

| within the human body while the memory alloy coil stent is in its deformed relatively straightened shape;  | proximity to the mammalian body while the memory alloy element is in its deformed shape;  |
|--|---|
| wherein the restraining member and the memory alloy stent are movable relative to each other to transform at least a portion of the alloy from its stress-induced martensitic state at a temperature greater than the $A_s$ of the alloy so that the memory alloy element transforms from its deformed shape towards its unstressed relatively coiled shape, and wherein the alloy is selected so that the transformation can occur without any change in temperature of the restraining member of the   | wherein the restraining member and the memory alloy element are movable relative to each other to transform at least a portion of the alloy from its stress-induced martensitic state at a temperature greater than the A <sub>s</sub> of the alloy so that the memory alloy element transforms from its deformed shape toward its unstressed shape, and wherein the alloy is selected so that the transformation can occur without any change in temperature of the restraining member or the memory   |
| memory alloy element.  '141 Patent Claim 16  | alloy element.  '378 Patent Claim 33  |
| 16. A medical device suitable for placement within a mammalian body for treatment of the mammalian body, the device comprising (i) a restraint, and (ii) a coil stent formed at least partly from a pseudoelastic shape-memory alloy, the alloy displaying reversible stress-induced martensite by being above its A <sub>s</sub> and above its M <sub>s</sub> and below its M <sub>d</sub> at about body temperature; such that it has a stress-induced martensitic state and an austenitic state, the element having (i) a relatively straightened shape when the alloy is in its stress-induced martensitic state and (ii) a different relatively coiled shape; | 33. A medical device suitable for placement within or proximate to a mammalian body for treatment of a mammalian body, the device comprising (i) a restraint, and (ii) an element formed at least partly from a pseudoelastic shape-memory alloy; the alloy displaying reversible stressinduced martensite by virtue of being above its A <sub>s</sub> and above its M <sub>s</sub> and below its M <sub>d</sub> at about body temperature; such that it has a stressinduced martensitic state and an austenitic state, the element having (i) a deformed shape when the alloy is in its stressinduced martensitic shape and (ii) a different unstressed shape; |

| wherein the restraint is (i) stressing     | wherein the restraint is (i) stressing     |

| '141 Patent Claim 17                       | '378 Patent Claim 1                        |
| <b>17.</b> The device of claim 1, 11, 15,  | 1. A medical device which comprises:       |
| or 16, wherein the mammalian body          | an element for use within a human          |
| is a human body.                           | body                                       |
| '141 Patent Claim 18                       | '378 Patent Claim 10                       |
| <b>18.</b> A medical device comprising:    | 10. A medical device for treatment         |
| (a) a wire stent formed at least partly    | of a mammalian body, the device            |
| from a pseudoelastic shape memory          | comprising: (a) a memory alloy             |
| alloy, the alloy displaying                | element formed at least partly from a      |
| reversible stress-induced                  | pseudoelastic shape memory alloy,          |
| martensite at about human body             | the alloy displaying reversible stress-    |
| temperature such as it has a               | induced martensite at about body           |
| deformed shape when the alloy is           | temperature such that it has a stress-     |
| 1 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2    | 1  |

| in its stress-induced martensitic         | induced martensitic state and an          |
|---|---|
| state and a different unstressed          | austenitic state, the memory alloy        |
| shape when the alloy is in its            | element having (i) a deformed shape       |
| austenitic state; and                     | when the alloy is in its stress-          |
| dusterritie state, and                    | induced martensitic shape and (ii) a      |
|   | different unstressed shape; and           |
| (b) a restraint stressing the wire stent  | (b) a hollow restraining member with      |
| - · ·                                     | the memory alloy element being within     |
| at a temperature greater than the As      | , ,                                       |
| of the alloy so that the wire stent is in | the restraining member, the restraining   |
| its deformed shape,                       | member engaging and stressing the         |
|   | memory alloy element at a temperature     |
|   | less than the body temperature of the     |
|   | human and greater than the As of the      |
|   | alloy for positioning the memory alloy    |
|   | element within or in proximity to the     |
|   | mammalian body while the memory           |
|   | alloy element is in its deformed shape;   |
| wherein the stent can be disengaged       | wherein the restraining member and the    |
| from the restraint upon placement in      | memory alloy element are movable          |
| a human so that the stent transforms      | relative to each other to transform at    |
| from its deformed shape to its            | least a portion of the alloy from its     |
| unstressed shape, and wherein the         | stress-induced martensitic state at a     |
| alloy is selected so that the             | temperature greater than the As of the    |
| transformation can occur without any      | alloy so that the memory alloy element    |
| change in temperature of the restraint    | transforms from its deformed shape        |
| or the wire stent.                        | toward its unstressed shape, and          |
|   | wherein the alloy is selected so that the |
|   | transformation can occur without any      |
|   | change in temperature of the restraining  |
|   | member or the memory alloy element.       |

The '141 Patent Claims are also not entitled to safe harbor under 35 U.S.C. § 121. Safe harbor is only available for claims issued from a divisional. *Amgen, Inc. v. F. Hoffman-La Roche, LTD*, 580 F.3d 1340, 1353 (Fed. Cir. 2009). The '141 Patent Claims stem from a continuation; none were subject to a final restriction requirement (see '141 History (**Exhibit 1025**), Transmittal Dated June 7, 1995

(acknowledging that application was a "continuation" application)). While the

Applicant attempted to later amend the application to be a divisional, this

amendment was ineffective and the USPTO and Applicant continued to treat the

application as a continuation (see '141 History (Exhibit 1025), Appeal Brief dated

June 18, 1998 at p. 1 (stating that appeal was for "a continuation" application)).

Further, the '141 Patent issued as a continuation application. The '141 Patent was

correctly identified on its cover page in its specification as a continuation (see '141

Patent), and at no time has the Applicant sought "correction" of such identification.

The '141 Patent Claims are thus not entitled to safe harbor.

#### **CONCLUSION** IX.

For the foregoing reasons, *Inter Partes* Review of the '141 Patent Claims is respectfully requested, followed by a grant of this Petition rejecting the '141 Patent Claims on each of the grounds detailed herein.

Dated: January 17, 2014

Respectfully Submitted,

David S. Moreland
